

## **Damp, water and moisture protection**

Air and Grounds product was originally formulated for the protection of mobile phones against damp and water damage however, after extensive testing it was found that the product would protect most types of low and high voltage equipment. As a result our product is now being used in many applications for the prevention of damp in electrical equipment.

***'All that is required to protect from damp or water is a coating of Air and Grounds Aqua Stop'***

One of the most expensive parts of low voltage electronic equipment is the printed circuit board. All it takes to destroy this board is damp. To combat this problem our engineers have formulated a single application protective coating that will prevent water ingress into a PCB board, therefore reducing the risk of the circuit board from shorting out and causing a very expensive repair.

Aqua Stop has been used successfully on Mobile Phones, PDA's, Lighting, Laptops, Walkie Talkies, Electrical Control Boxes, Switchgear, Vehicle Lighting and much more.

This product is that it will work on all voltages AC or DC. Equipment treated with Aqua Stop remain repairable without having to strip the coating off. Simply re-apply once repair is complete.
